SPECULA | Resource acquisition audit

Preliminary local inventory - 11 November 2026 (Asia/Calcutta)

Status: checklist required

The named Complete Download and Resource Checklist was not available. The first ten acquisitions and P0/P1/P2 assignments cannot be determined. No external downloads, clones, source checks or access requests are claimed. This report documents feasible local work only.

Local audit measure	Observed value
Existing files inventoried	2489
Stable files with local SHA-256	2458
Hash deferred or unavailable	31
Exact duplicate groups / files	93 / 654
Evaluator-only indexed artifacts	40
New external acquisitions	0
Free storage at audit	110.9 GiB

Existing resources

The parent project is available. The inventory includes ATT&CK; v19.2 workbooks (version from filenames only), local evidence and derived data, project documents, verification receipts, pilot evaluation outputs and answer keys. Project PDFs have not been identified as scholarly papers. Existing materials are referenced in place; no originals were moved or overwritten.

Integrity and provenance limits

Recorded SHA-256 values identify observed local bytes. They have not been matched to publisher checksums. ZIP-based files receive CRC checks only when expanded size is at most 64 MiB. Mutable datastores and files exceeding the audit read budget remain explicitly unverified. Duplicate reports identify equal nonempty bytes; no duplicates were deleted. Backup locations do not prove outdated content. Official versions, release dates, licences, dependencies and download completeness remain unassessed.

Ground truth separation

Evaluator keys and evaluation-derived artifacts are indexed under 07_Evaluation_Artifacts/evaluator_only. No labels were copied to the dataset or benchmark directories. Existing parent locations remain unchanged. This is organizational separation, not access control; agent evidence roots must exclude evaluator material. The local pilot is not an independently validated empirical benchmark.

Deliverables and interpretation

The master tracker and initial inventory record existing local files. Dataset and repository manifests record local candidates and the exact existing repository commit. The scholarly bibliography and restricted-resource report contain headers only because their checklist-driven scope is unknown. The missing-resource report records the missing checklist, not speculative missing datasets. Resource checksums and verification exceptions record per-file limitations.

Next action

Supply the exact checklist document or local path. Then map existing assets to each required item, check original official sources, record version/release/licence/dependencies/size, acquire the first ten in document order and continue through remaining priorities. Assess storage and request approval before large downloads, paid resources or restricted-access requests. No tools were installed or implementation files changed.
